

## ClearSignal® ANTIFOULING COATING

ClearSignal® is a clear non-toxic coating that resists biofouling due to the non-stick properties of the coating itself. ClearSignal® utilizes advanced material technologies to achieve its properties and performance giving a permanent coating that is designed to last for years on the platform or instrument it is protecting. Unlike traditional antifouling systems which rely on active biocides and whose effectiveness degrades within a short time, ClearSignal® remains 100% effective.

ClearSignal® is acoustically transparent, so that the performance of hydroacoustic instruments is not affected by the treatment.

In addition ClearSignal® is transparent so that existing product labeling will be visible after treatment.

ClearSignal® was originally developed for the offshore industry and has been adapted for use in oceanographic sectors, including equipment for use in fish farming. ClearSignal® contains no toxic components and can be safely used in all aquatic environments.

The benefits of ClearSignal® are:

- Non-toxic
- Optically and acoustically transparent
- Long term effectiveness
- Designed to last for years on instrument or platform
- Significant reduction in labor hours for maintenance
